

PR Cases for a model file (per-path flow)

Terminology (see doc/README.md):

- source = PR head ref
- target = PR base ref
- merge base = common ancestor

Is path relevant (matches configured model extension)?

Relevant?

Determine file status (added/deleted/modified/renamed)

Added or deleted?

Skip: not a configured model file

Report outcome: creation/deletion at file level

Resolve metamodel for this file

Metamodel resolved?

Load source and target versions as models

Both versions load?

Compute merge base and decide comparison mode

Both source and target changed vs merge base?

Case: 3-way comparison → <3-way-comparison.puml>

Case: 2-way comparison → <2-way-comparison.puml>

Case: parse/load failure

Case: metamodel resolution failure

Report outcome: analysis incomplete

Report outcome: analysis incomplete
